

Wucu AU

SEVEN DAYS · ONE AUv3

USER GUIDE · VERSION 1.0.0

K.ODK

Seven days, in your session

Wucu AU puts the weekday series — seven standalone apps, one for each day — inside your DAW as AUv3 plug-ins. Three are instruments, four are effects.

Each plug-in is an extract. It takes a part of the standalone app with the same name and rebuilds it for a plug-in slot. It is not the whole app. The standalone apps are larger, patchable instruments made to be played on their own. Wucu AU keeps the sound and the gestures you most want to reach for while you make a track, and it leaves the rest behind.

Many of you asked for a way to use these sounds in finished pieces — to add a little improvised colour to a track rather than build a whole patch. That is what this is. Load one on a track, touch a pad, record what it does.

Every plug-in looks like its own app, so you can tell the days apart at a glance. They all share a few habits: a **RANDOM** key at the top right that throws new settings, a small level meter beside it, and everything automatable from the host.

Too much to read? Skip it. Put an instrument on a track, play a few notes, then press **RANDOM** until something catches your ear. For the effects, send them a drum loop or a voice and do the same. RANDOM never touches the output level or the mix, so it will not blow your speakers.

Contents

02	Requirements and installing
03	The seven at a glance
04	Mōnandæg — multi effect (Monday)
05	Tīwesdæg — input as two decks (Tuesday)
06	Wōdnesdæg — 64 sines (Wednesday)
07	Þunresdæg — feedback loop (Thursday)
08	Frīgedæg — grains (Friday)
09	Sæternesdæg — fold synth (Saturday)
10	Sunnandæg — one sine, three stages, with camera (Sunday)
11	Versions and support

What it needs

System

IPHONE · IPAD	iOS 18.0 or later, inside any AUv3 host — for example Logic Pro for iPad, GarageBand, AUM or Cubasis.
MAC	macOS 14 or later, inside Logic Pro, GarageBand or any host that loads Audio Units.
RECOMMENDED	Wucu AU is developed and tested on an iPhone 13 and on Apple-silicon Macs.
CAMERA	Used by Sunnandæg only, and only when you switch it on (section 10). The picture is reduced to a few movement values and is never stored or sent.
PRIVACY	Nothing leaves the device. Wucu AU does not use the network.

Installing

Mac. Open the Wucu app once. It registers the plug-ins and tells you so; you can close the window afterwards. If the plug-ins do not appear, quit and reopen your host. In Logic Pro you can also rescan them in **Settings → Plug-in Manager**.

iPhone and iPad. Install the app and open it once. The app is also a small test bench: pick a day along the top and play it right there, with the on-screen keys or a connected MIDI keyboard. For the effects, tap **MIC** and use headphones.

Where to find them

INSTRUMENTS	On a software instrument track: **Instrument → AU Instruments → kodk →** Wodnesdaeg, Saeternesdaeg or Sunnandaeg.
EFFECTS	In an effect slot: **Audio FX → Audio Units → kodk →** Monandaeg, Tiwesdaeg, Thunresdaeg or Frigedaeg.

Hosts show the names without the old letters (Wodnesdaeg for Wōdnesdæg, Thunresdaeg for Þunresdæg). They are the same plug-ins.

Three instruments, four effects

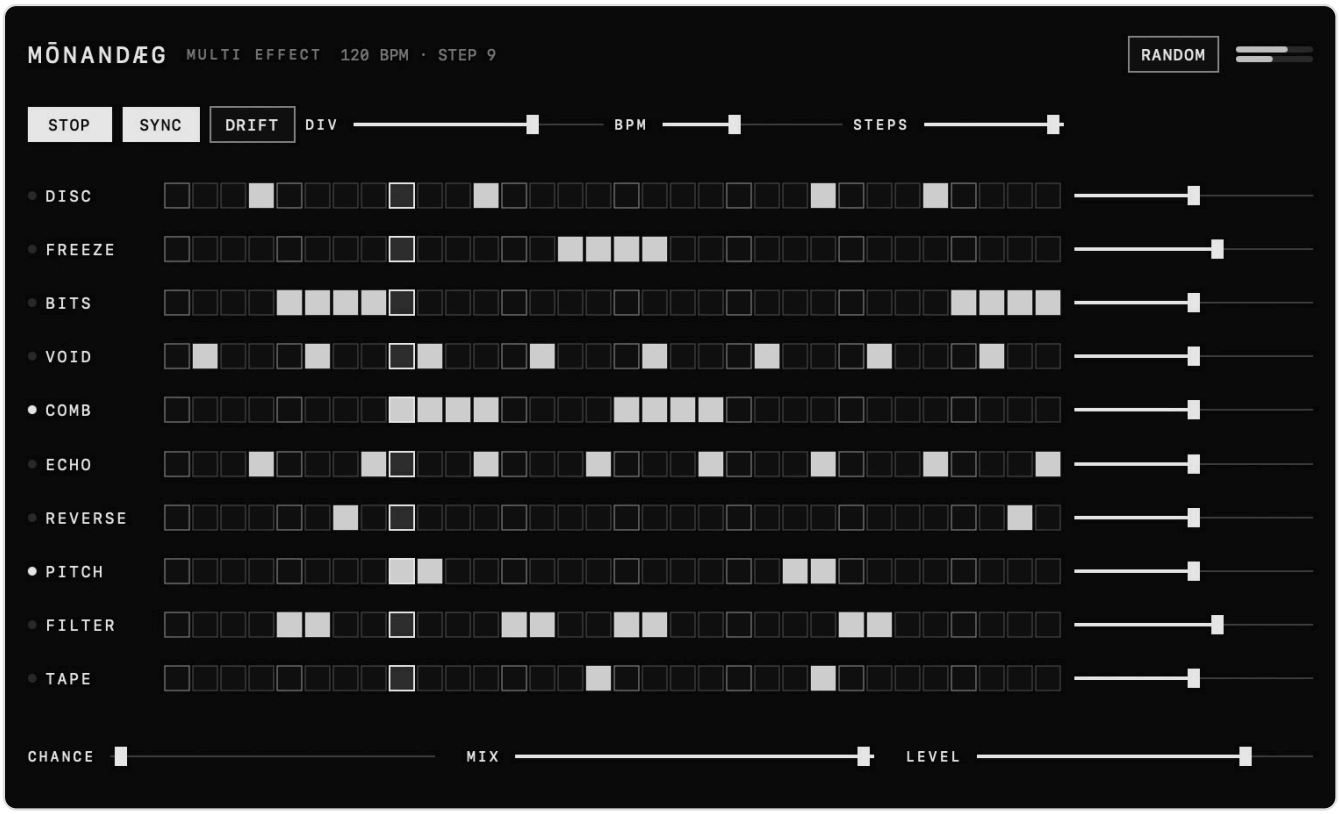

Each plug-in is named for a day, and each one is an extract of the standalone app with that name.

MON	FX **Mōnandæg** — multi effect. Ten effects switch on and off along a 32-step pattern that follows the host's tempo.
TUE	FX **Tīwesdæg** — input as two decks. The incoming sound is recorded into two decks, and each deck plays like an oscillator that the other one bends.
WED	INST **Wōdnesdæg** — 64 sines. A chord drone made of up to 64 sine waves, in six tunings.
THU	FX **Þunresdæg** — feedback loop. Two phasers, a delay and a tone stage joined in one loop, moved by small equations instead of random numbers.
FRI	FX **Frīgedæg** — grains. Records the input live and plays it back as a cloud of up to 128 grains, with a filter and a delay.
SAT	INST **Sæternesdæg** — fold synth. An eight-voice polyphonic synth whose sound comes from wave folding.
SUN	INST **Sunnandæg** — one sine, three stages. A single sine folded three times and fed back on itself. It has a **camera**: your movement can play the pads.

Shared controls

RANDOM	Throws new settings for the sound controls. Level, mix, hold switches and other "safety" controls are left alone.
METER	The two small bars beside RANDOM show the left and right output. They turn orange near the top.
PADS	Drag the dot. Each pad moves two controls at once; their names are written on the pad's edges.
AUTOMATION	Every control is a host parameter, so it can be automated, mapped to a MIDI controller and saved with your project.

Mōnandæg MULTI EFFECT

Ten effects in rows, and a 32-step pattern that turns each one on and off in time with your song. When the step reaches a lit square, that effect is applied to the sound. The standalone Mōnandæg is a larger instrument; here you get its step-switched effects as a single insert.

THE ROWS

DISC, FREEZE, BITS, VOID, COMB, ECHO, REVERSE, PITCH, FILTER, TAPE. Tap a square to switch that step on or off. The slider at the end of each row sets how strong that effect is. A dot before a name lights while the effect is active.

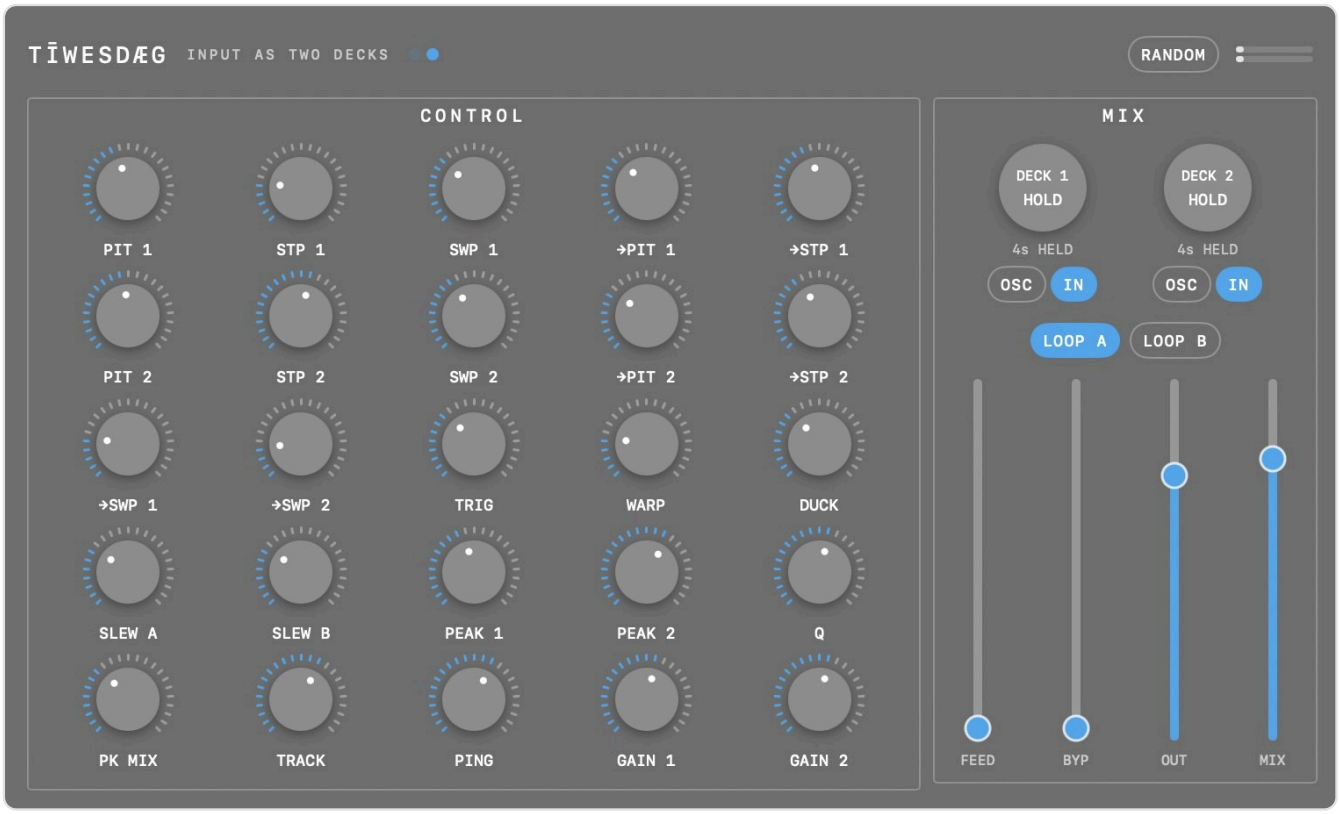

TRANSPORT

STOP / RUN stops or starts the pattern. **SYNC** follows the host's tempo and position. With SYNC off, **BPM** sets its own tempo.

DIV	Step length, from whole notes to 1/32.
STEPS	Pattern length, 1 to 32 steps.
DRIFT	Every 4 to 16 steps, the amounts and a few squares rearrange themselves.
CHANCE	The amounts sway on each step, and now and then an effect joins that is not in the pattern.
MIX · LEVEL	Dry/wet balance and output level.
RANDOM	Writes a new pattern and new amounts.

Tīwesdæg

INPUT AS TWO DECKS

The standalone Tīwesdæg treats two audio files as oscillators that push each other around. This extract does the same with the sound coming into the plug-in: it is recorded into two decks of about four seconds, and the two decks play off one another — bending each other's pitch, stepping and sweeping.

MIX PANEL

DECK 1 · 2 HOLD	Freezes what the deck has recorded. While held, the deck keeps playing the same four seconds.
OSC · IN	Each deck plays either its built-in oscillator (OSC) or the recorded input (IN).
LOOP A · B	Loops deck 1 (A) and deck 2 (B).
FEED · BYP · OUT · MIX	Feedback into the decks, how much dry signal passes by, output level, and dry/wet.

CONTROL PANEL

PIT · STP · SWP 1 / 2 — pitch, step and sweep for each deck.

→PIT · →STP · →SWP — how much one deck bends the other.

TRIG · WARP · DUCK — how the meetings of the two decks strike, bend and duck the sound.

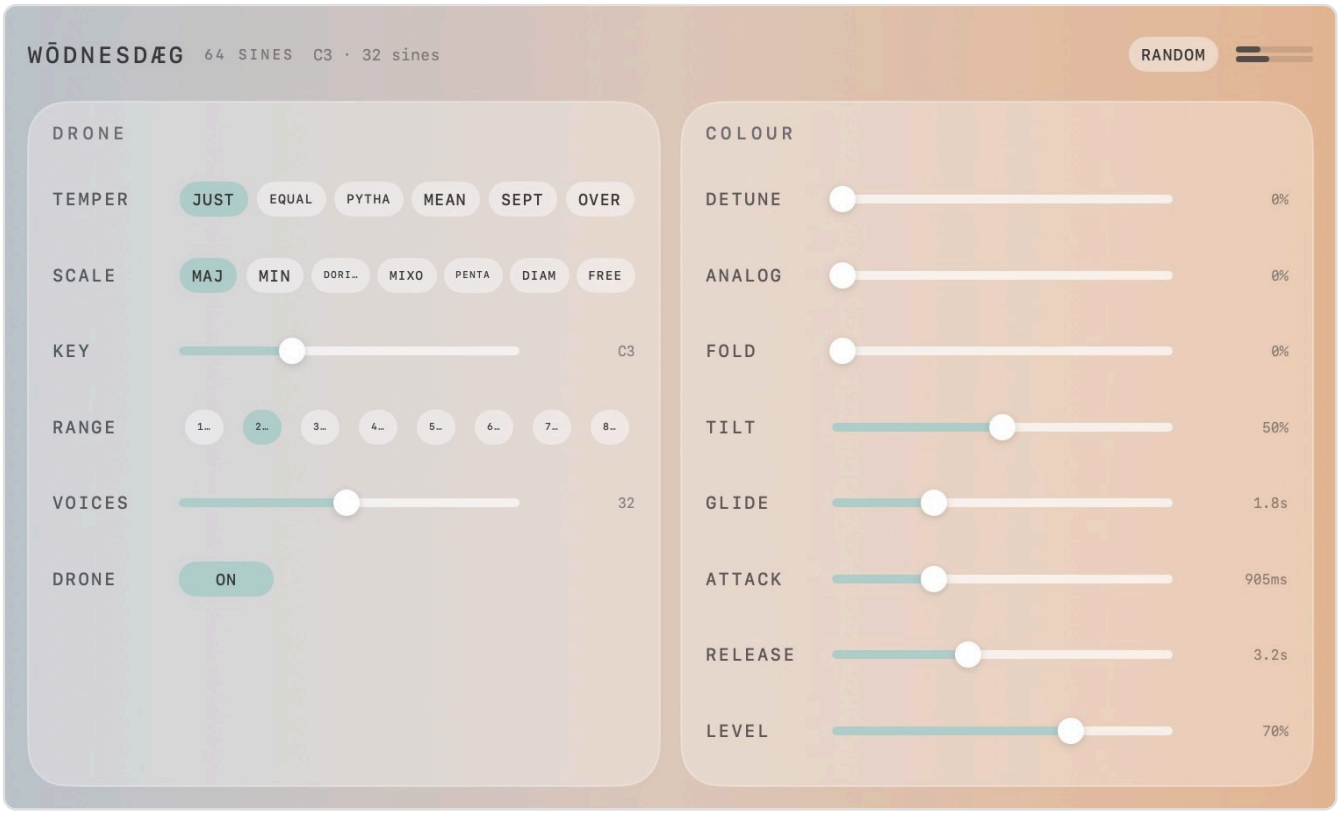

SLEW A · B — smooths the movements.

PEAK 1 · 2 · Q · PK MIX — two resonant peaks that ring when the decks cross.

TRACK · PING — how the peaks follow the decks and how hard they are struck.

GAIN 1 · 2 — input level into each deck.

Wōdnesdæg 64 SINES

A chord drone built from many sine waves. The standalone Wōdnesdæg adds presets, recording, a mixer and more; this extract keeps the drone and its colour, so you can lay a slow, tuned bed under a track.

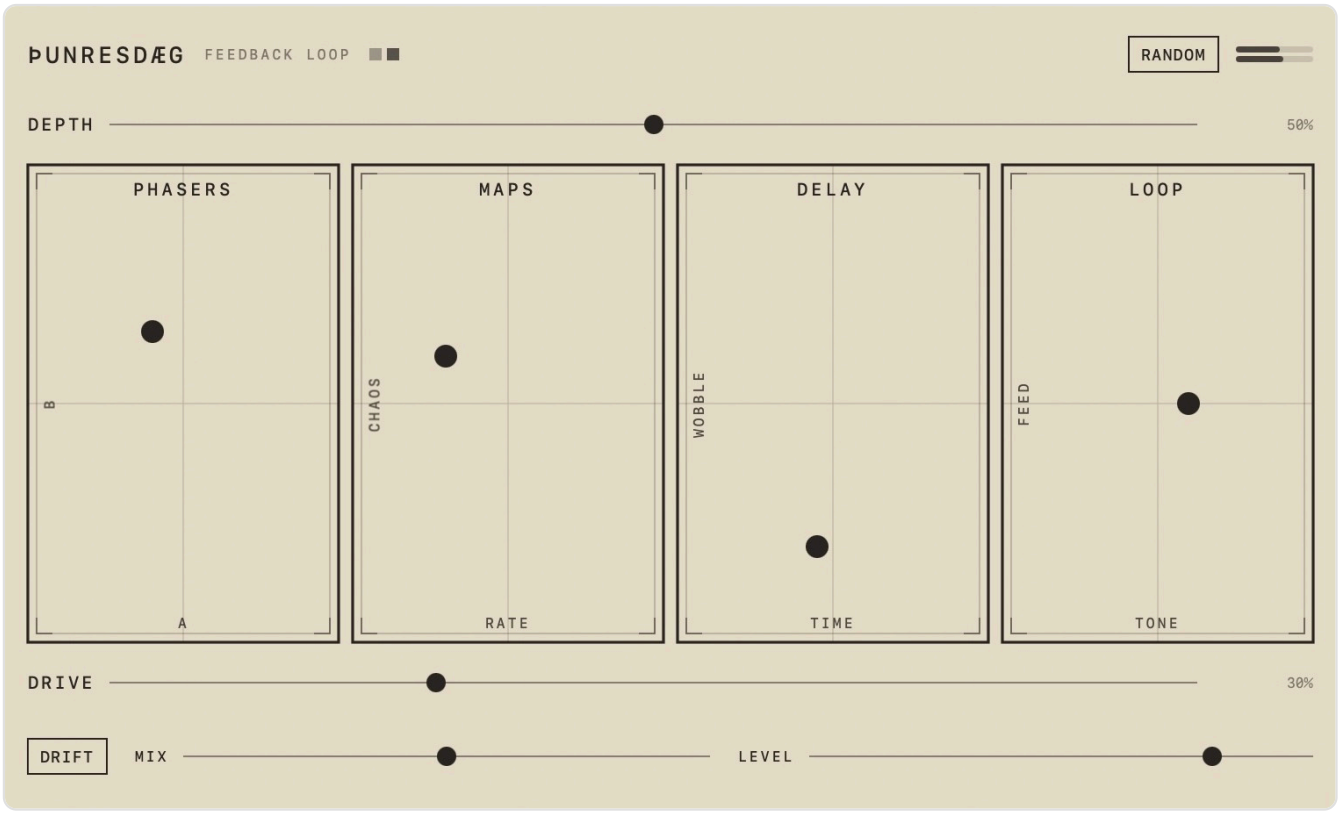

DRONE

TEMPER	The tuning: JUST, EQUAL, PYTHAgorean, meanTONE, SEPTimal, OVERtone.
SCALE	The scale within that tuning. The choices change with the tuning.
KEY	The root note. A MIDI note also sets it.
RANGE	How many octaves the sines spread over, 1 to 8.
VOICES	How many sines sound, 1 to 64.
DRONE	ON: it sounds all the time. OFF: it sounds while a key is held.

COLOUR

DETUNE	Spreads the sines apart for beating.
ANALOG	Slow, uneven drift in pitch.
FOLD	Folds the summed wave for brighter edges.
TILT	Balance between low and high sines.
GLIDE	How slowly it moves to a new key.
ATTACK · RELEASE	How it fades in and out.
LEVEL	Output level.

Þunresdæg FEEDBACK LOOP

Two phasers, a delay and a tone stage joined in a single loop. The movement comes from small equations — the tent map and its relatives — so nothing in it is random. The standalone Þunresdæg is a patchable board of map oscillators and effects; this extract is its feedback loop, made to go on any track.

THE FOUR PADS

PHASERS	A · B — the centre of each of the two phasers.
MAPS	Rate · Chaos — how fast the equations move the loop, and how wild.
DELAY	Time · Wobble — the delay length and its movement.
LOOP	Tone · Feed — the colour of the loop and how much returns. Near the top it starts to play by itself; Drive keeps it from breaking up.

DEPTH	How deep the phasers sweep.
DRIVE	Saturation inside the loop.
DRIFT	Now and then the controls move to new values on their own, with a fine wobble on top.
MIX · LEVEL	Dry/wet balance and output level.

With a high **Feed**, Þunresdæg keeps sounding after the input stops. Turn Feed down, or Level, to bring it back.

Frīgedæg GRAINS

The standalone Frīgedæg records outside sound and turns it into granular, microsound textures. This extract keeps the heart of it: whatever comes into the plug-in is recorded live into an eight-second buffer, drawn as a waveform, and played back as a cloud of up to 128 short grains.

THE WAVEFORM PAD

Left is older, right is newer. Drag sideways to set **POSITION** — where the grains are read from. Drag up and down to set **SPRAY** — how far they scatter around that point (the shaded band). The dots show grains as they play. The header shows how many grains are sounding and how much is recorded.

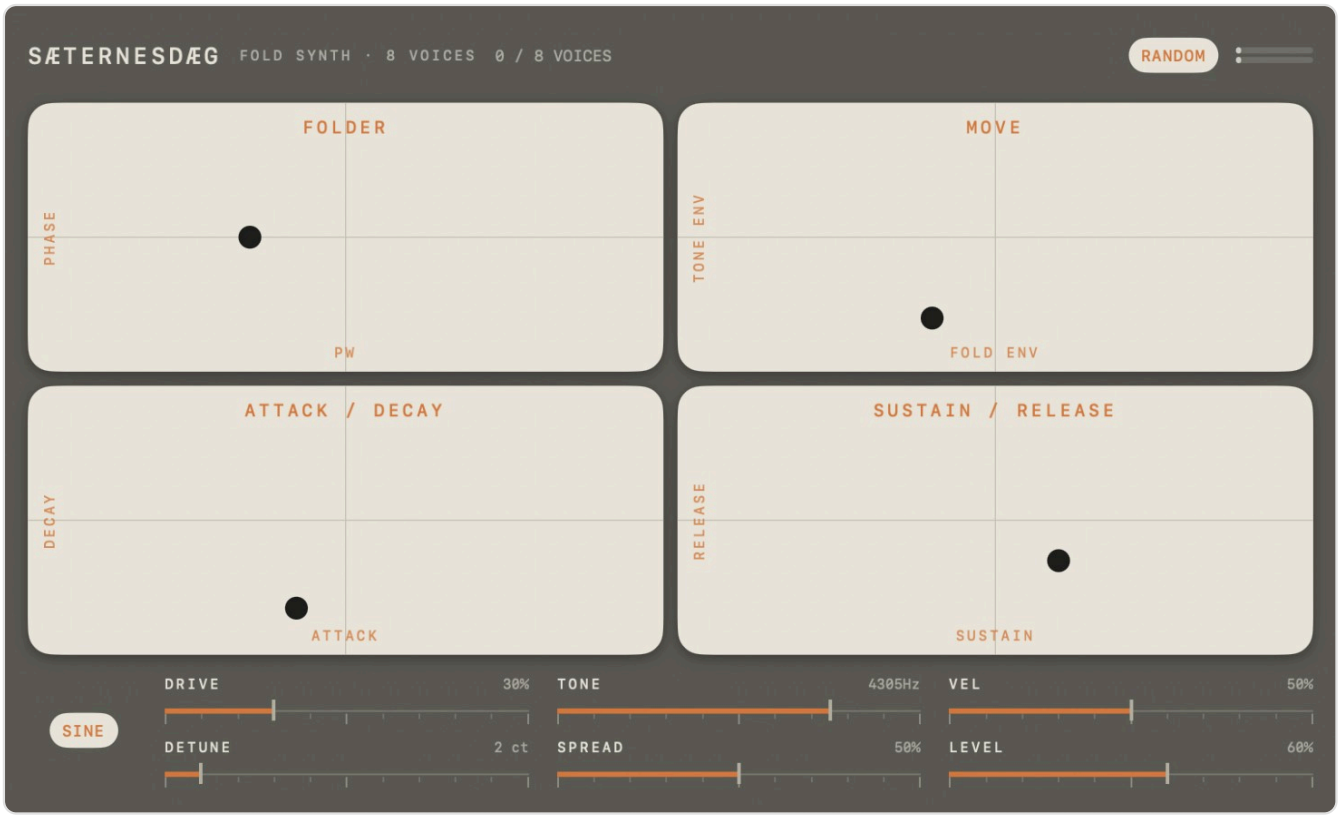

SWITCHES

HOLD stops recording, so you can play with what is in the buffer. **DRIFT** lets the position wander slowly. **LP · BP · HP** picks the filter type.

RATE · SIZE	Grains per second and grain length.
CONTOUR	Grain shape, from sharp to soft.
PITCH	Pitch of the grains in musical steps, up to two octaves either way.
RND PITCH	Scatters grains over consonant intervals — fifths, fourths, octaves.
RND RATE · SIZE · AMP · REV	Randomness of timing, length, loudness and reverse playback.
FEEDBACK	Writes the grains back into the buffer.
CUTOFF · RESO	The filter.
DLY TIME · FEED	A stereo delay after the grains.
MIX	Dry/wet balance.

Sæternesdæg

FOLD SYNTH · 8 VOICES

The standalone Sæternesdæg is one oscillator run through a chain of modules with feedback. This extract takes its folding sound and makes it a playable, eight-voice polyphonic synth. The header shows how many voices are playing.

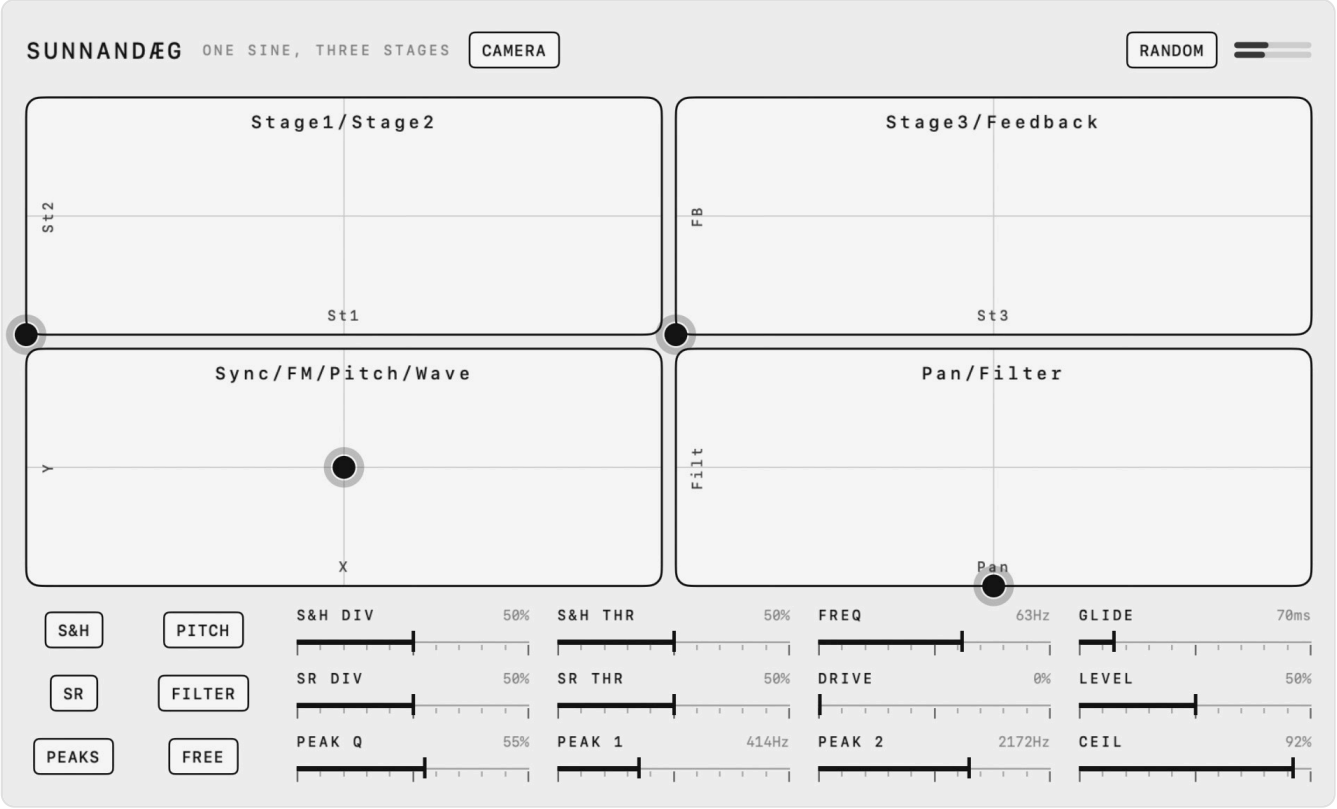

THE FOUR PADS

FOLDER	PW · Phase — how the wave is folded.
MOVE	Fold env · Tone env — how much each note's envelope opens the folding and the tone.
ATTACK / DECAY	The start of each note.
SUSTAIN / RELEASE	The held level and the tail.

WAVE	SAW, TRI, SINE or PULSE — the wave that goes into the folder.
DRIVE	Pushes the wave harder into the folder.
TONE	Overall brightness.
VEL	How much velocity changes the sound.
DETUNE · SPREAD	Thickens the voices and spreads them in stereo.
LEVEL	Output level.

Sunnandæg

ONE SINE, THREE STAGES

A plain sine wave, folded three times over, and the result sent back into itself. From then on the sound answers itself, and the same gesture rarely gives the same sound twice. The standalone Sunnandæg adds a patchable modulation bus, effects, microsound and more; this extract keeps the loop, so it can bring a little improvised colour into a track.

CAMERA

Press **CAMERA** and Sunnandæg watches you. The picture is split into four quarters, one for each pad, and movement in a quarter moves that pad's dot. Wave a hand and the sound follows. On the Mac it works right inside the plug-in; the picture is mirrored, so moving your right hand moves the right-hand pads. On iPhone and iPad, iOS does not let plug-ins use the camera, so use it in the Wucu app.

KEYS

MIDI notes play the pads. Four octaves, starting from the Key Octave setting (a host parameter), each belong to one pad: the note within the octave moves the dot sideways, and velocity moves it up and down.

THE PADS	Stage 1 · 2, Stage 3 · Feedback, a pad that changes the character of the loop, and Pan · Filter.
S&H · PITCH	Sample and hold, and where it goes. S&H div · thr set its timing and threshold.
SR · FILTER	A shift register, and where it goes. SR div · thr set its timing and threshold.
PEAKS · FREE	A peak filter with two resonant peaks, and its band (FREE, LP, BP, HP). Peak Q · 1 · 2 tune it.
FREQ · GLIDE	The pitch of the sine and how slowly it moves.
DRIVE · CEIL	Saturation and the output ceiling.
LEVEL	Output level.

Version 1.0.0

CURRENT

1.0.0

iPhone, iPad and Mac · iOS 18.0 / macOS 14 or later · AUv3. This guide describes this version.

In this version

SEVEN PLUG-INS	Three instruments (Wōdnesdæg, Sæternesdæg, Sunnandæg) and four effects (Mōnandæg, Tīwesdæg, Þunresdæg, Frīgedæg), each an extract of its standalone app.
CAMERA	Sunnandæg can be played by movement in front of the camera.
TEST BENCH	The iOS app plays all seven on its own, with on-screen keys, MIDI keyboards and the microphone.

The standalone apps

Mōnandæg, Tīwesdæg, Wōdnesdæg, Þunresdæg, Frīgedæg, Sæternesdæg and Sunnandæg are on the App Store as separate apps for iPhone and iPad. Each one is the full instrument that its Wucu AU plug-in is drawn from.

Written in Swift and C, with no third-party audio code. Wucu, Old English (West Saxon) for "week".
